

Coffee Space

Café Operations Platform

WORKING PROTOTYPE

BUSINESS ANALYSIS CASE STUDY

From sale to stock to profit - in one workflow.

- Built around café operations, not screens alone
- Manager control with cashier simplicity
- BRD, product walkthrough and working prototype

The problem I designed for

Daily performance becomes unclear when sales, stock, purchases and costs live in separate places.

Sales

Recorded in POS, usually separate from stock and costing.

Inventory

Updated manually or late, especially for raw materials.

Purchases

Supplier and cost changes often sit in spreadsheets.

Profit

Clear at month-end, not during day-to-day decisions.

Operational gap

A sale should not stop at a receipt.

It should immediately update the stock position, cost calculation and same-day P&L.

Sale

>

Stock

>

COGS

>

P&L

BA lens

The scope starts from operations: who needs to decide, what data they need, and which controls protect the business.

The solution: one operating layer

Coffee Space connects the café workflow from transaction to report.

01

Takeaway / dine-in + table selection

02

Recipe-based stock deduction

03

Weighted-average purchase costing

04

Gross, net, margin and AOV

Design principle

Every confirmed sale immediately affects stock, cost and same-day performance. A cashier sells fast; a manager controls cost, margin and operations.

What makes it a BA case

The prototype is supported by a BRD: problem, goals, stakeholders, scope, requirements, business rules and acceptance criteria.

Manager dashboard

A same-day operational pulse, not just a sales number.

Daily control

Sales, gross profit, expenses, net profit, orders and average ticket.

Inventory visibility

Low-stock alerts and inventory value help managers act before shortages happen.

Live operations

Recent tickets show line detail so the manager can trace what changed today.

POS flow

Fast for the cashier, connected to the operation behind it.

The screenshot displays the Coffee Space POS interface. At the top, there's a header with user information (أحمد حسن, manager@, EN, C) and a search bar. The main area is a grid of coffee items, each with a name, price, and a small icon. The items are categorized into 'مشروبات القهوة' (Coffee Drinks) and 'مخبوزات وحلويات' (Bakery and Sweets). A sidebar on the right contains a menu with various options like 'الرئيسية', 'نقطة البيع', 'الصالة والترانزات', etc. At the bottom, there's a summary panel showing the total amount (85 ج.م) and a button to confirm the sale (تأكيد البيع).

Item Name	Price (ج.م)
قهوة تركي سنجل	35
قهوة تركي دبل	50
قهوة فرنسي	55
إسبريسو دبل	60
أمريكانو	70
ماكياتو	70
كورتادو	75
فلات وايت	95
لانيه	105
كابوتشينو	130
سبانيش لانيه	125
موكا لانيه	125
كرواسون سادة	100
شوكليت براونى	80
كيك تفاح بالقرعة	120
عبد المعبود سادة فانيج - 100 جم	105
عبد المعبود سادة وسط - 200 جم	175
عبد المعبود سادة غامق - 200 جم	175

Cart logic

$Qty \times unit\ price = line\ total$, then grand total.

Dine-in rule

Dine-in requires table selection; takeaway does not.

On confirm

Prepared items deduct recipe materials. Retail packs deduct stock quantity.

Receipt

Sale is tagged with branch, user, table, payment method and order type.

Floor service and inventory

The service flow and stock flow support the same café operation.

Floor: tables, seats, indoor/outdoor, active status

Inventory: raw materials, packaged SKUs, min levels, waste and value

Reports and profitability

Sales, COGS, gross profit, expenses, net profit and margin in one view.

Period views

Day, week and month views for sales and profitability.

Top products

Qty and revenue ranking for product-level decisions.

CSV export

Order-line detail can move to Excel or Google Sheets for analysis.

Cost discipline

Weighted-average cost improves stock value and COGS accuracy.

Access control

Manager vs Cashier is a business control, not just navigation.

Manager: full access to inventory, costs, users, finance and reports

Cashier: simplified dashboard + POS only, no cost or margin fields

Business Analysis deliverable

The BRD turns the prototype into a clear product scope.

Problem

Disconnected sales, stock, costs and reporting.

Goals

Know daily performance and protect cost visibility.

Requirements

POS, inventory, purchasing, expenses, reports, roles.

Rules

Dine-in needs table; cashier cannot access costs.

Acceptance

Sale updates stock and dashboard; reports export CSV.

Next phase

Server API, secure auth, shared DB and sync.

Portfolio message: I translated an operational problem into a documented product scope and a working prototype.

Coffee Space

Run the demo. Review the BRD. Walk sale-to-report.

Manager access

manager / Manager@2026

Cashier access

cashier / Cashier@2026

Positioning

Business Analyst / Business Developer with hands-on Product Thinking

Thank you
